## Problem Definition

Breaking Blocks is a puzzle game where the goal is to clear a grid by destroying interconnected squares of the same color. The challenge lies in finding an optimal path to eliminate all connected squares strategically, considering their top, right, left, and bottom links. Success in the game depends on identifying a solution path that efficiently clears the board while adhering to the color-matching criteria.

## └ Agent Specification ( PEAS ) ─

Performance Measure	<ul style="list-style-type: none"><li>- the number of squares cleared in a given time.</li><li>- the time taken to complete the level and space</li></ul>
Environment	<ul style="list-style-type: none"><li>- a grid of colored squares linked in a top, right, left, and bottom manner.</li><li>- The state of the environment changes as the agent makes moves to destroy interconnected squares</li></ul>
Actuators	<ul style="list-style-type: none"><li>- select and destroy squares in the grid.</li></ul>
Sensors	<ul style="list-style-type: none"><li>- the colors of the squares and their connectivity</li><li>- Look at the last row to see if it is complete or not</li></ul>

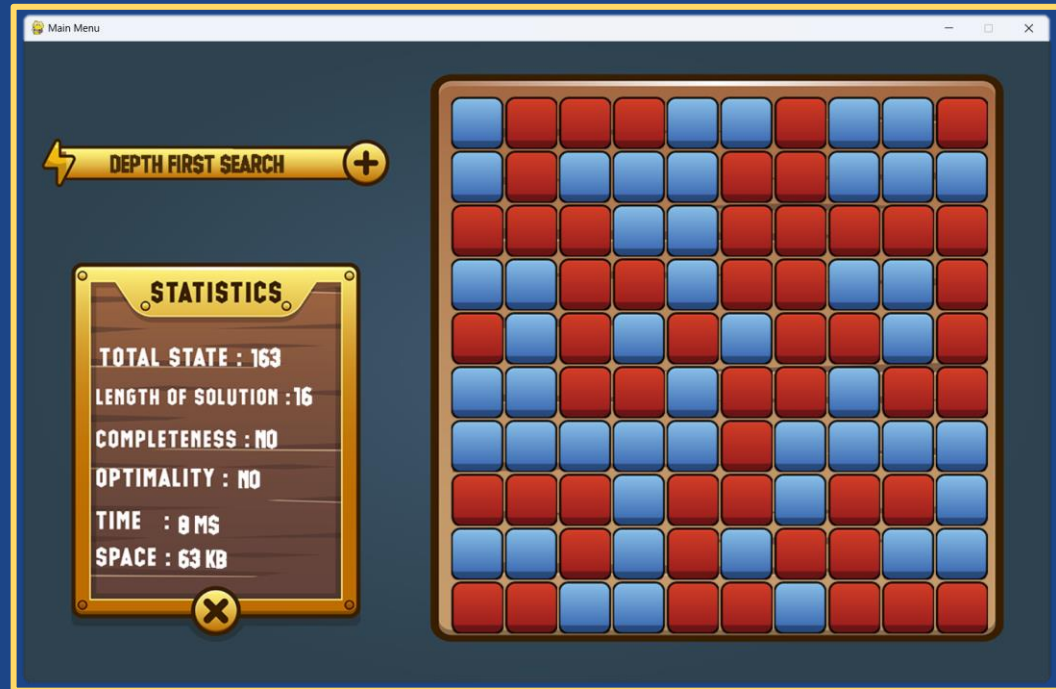

## Problem Formulation

**Start State** : The initial configuration of the game grid, where interconnected squares of various colors exist

## Problem Formulation

**Goal Space** : The goal state is reached when all interconnected squares of the same color are eliminated, resulting in a cleared grid

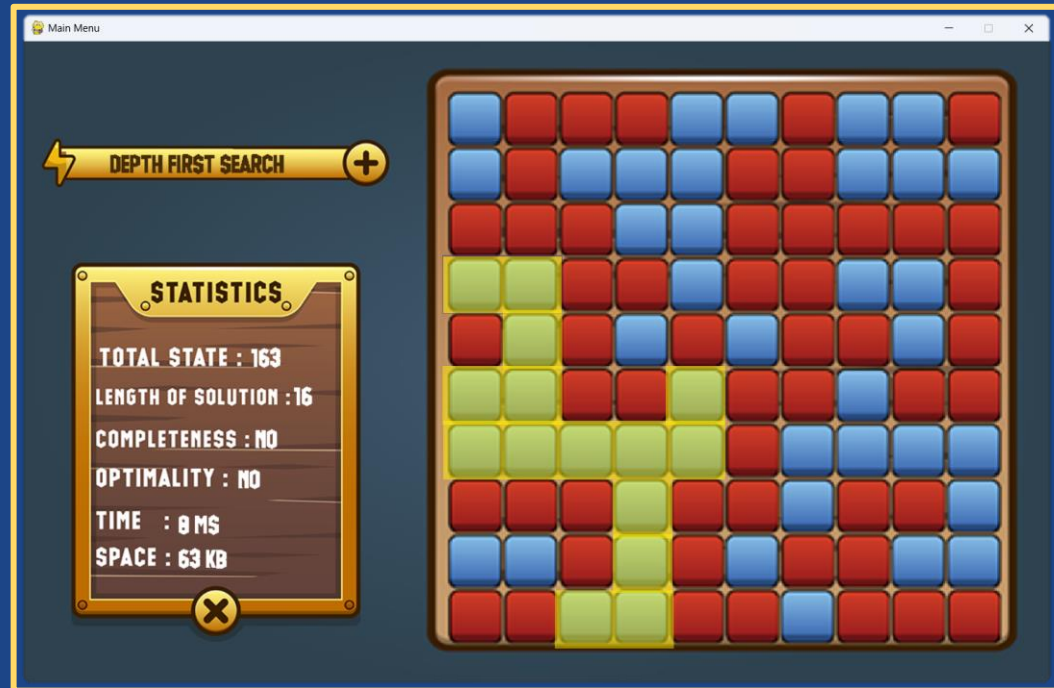

# Problem Formulation

## Actions :

Select a square to destroy.

Trigger a chain reaction by eliminating a square, causing interconnected squares of the same color to be destroyed.

# Problem Formulation

## State Space :

The state space encompasses all possible configurations of the Breaking Blocks game grid that can be reached through legal moves

## Problem Formulation

**Path Cost** : Total number of explosions taken to reach the target state

# Problem Formulation

## Task Environment :

**Fully Observable:** States are entirely observable as the complete configuration of interconnected squares on the game grid is visible to the agent through sensors.

**Deterministic:** The environment is deterministic because the next state can be entirely determined by the current state and the agent's actions. There are no random or unpredictable elements in the transitions between states.

**Sequential:** The environment is sequential as the current decision made by the agent influences future decisions. Actions taken at one

# Problem Formulation

## Task Environment :

**Static:** The environment is static because the Breaking Blocks game doesn't introduce external changes or unpredictable events. The agent is only concerned with the current state and doesn't need to consider dynamic elements beyond its control.

**Discrete:** The environment is discrete since there is a limited and defined number of distinct, clearly defined states. The game grid consists of a finite number of interconnected squares, and the agent's actions result in discrete changes to the configuration.

**Single Agent:** There is only one agent involved in the Breaking Blocks game. The actions and decisions of this solitary agent determine the progression of the game, and there is no interaction with other agents.

 Ai Project

 **A STAR ALGORITHM** 

**STATISTICS**

**TOTAL STATE : 928**

**LENGTH OF SOLUTION : 4**

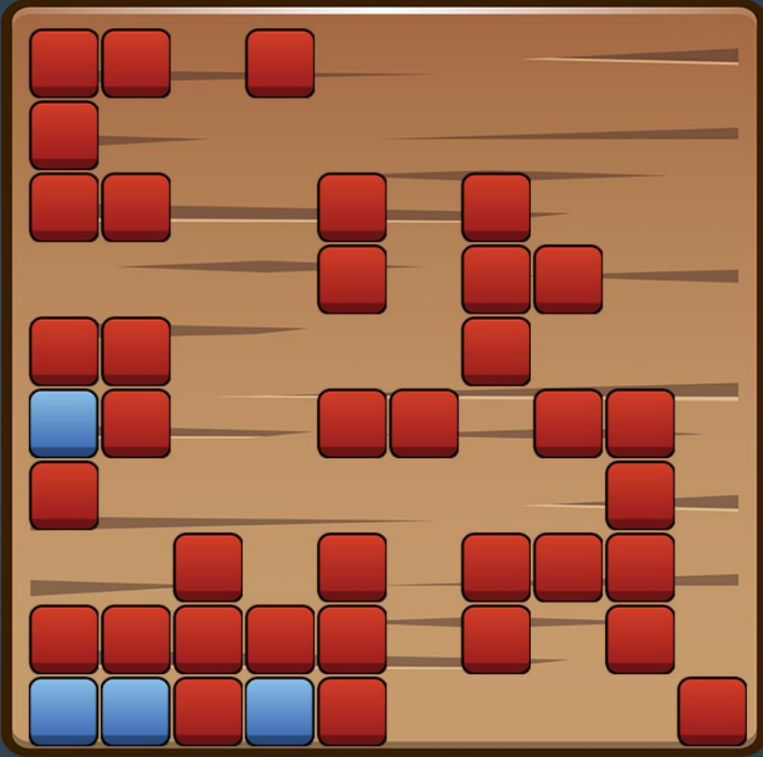

**COMPLETENESS : YES**

**OPTIMALITY : YES**

**TIME : 93 MS**

**SPACE : 362 KB**

A 4x5 grid representing a 15-puzzle state. The grid contains 15 numbered tiles. The tiles are arranged as follows (row by row):

- Row 1: 14, 13, 12, 11
- Row 2: 15, 10, 9, 8
- Row 3: 7, 6, 5, 4
- Row 4: 3, 2, 1, 16

The tiles are numbered 1 through 15, with 16 representing the empty space. The tiles are colored red, except for the tiles numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, which are colored blue.

Thank You
